ABSTRACT

We extend the definition and study the algebraic properties of the polylogarithm Li_T , where T is rational series over the alphabet $X = \{x_0, x_1\}$ belonging to $(\mathbb{C}\langle X \rangle)_{\sqcup} \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle_{\sqcup} \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle_{\sqcup, 1_{X^*}}$.

Keywords

Algebraically independent ; Polylogarithms ; Transcendent.

1. Introduction

In all the sequel of this text,

1. We consider the differential forms

$$\omega_0(z) = \frac{dz}{z} \quad \text{and} \quad \omega_1(z) = \frac{dz}{1-z}.$$

We denote Ω the cleft plane $\mathbb{C} -]-\infty, 0] \cup [1, +\infty[$ and λ the rational fraction $z(1-z)^{-1}$ belonging to the differential unitary ring $\mathcal{C} := \mathbb{C}[z, z^{-1}, (1-z)^{-1}]$ with the differential operator $\partial_z := d/dz$ and with the unitary element

$$\begin{aligned} 1_\Omega : \Omega &\longrightarrow \mathbb{C}, \\ z &\longmapsto 1. \end{aligned}$$

2. We construct, over the alphabets

$$X = \{x_0, x_1\}, \quad Y = \{y_k\}_{k \geq 1} \quad \text{and} \quad Y_0 = Y \cup \{y_0\},$$

totally ordered by $x_0 < x_1$ and $y_0 > y_1 > \dots$ respectively, the bialgebras¹

$$\begin{aligned} (\mathbb{C}\langle X \rangle, \text{conc}, \Delta_{\sqcup}, 1_{X^*}, \varepsilon), \\ (\mathbb{C}\langle Y \rangle, \text{conc}, \Delta_{\sqcup}, 1_{Y^*}, \varepsilon), \\ (\mathbb{C}\langle Y_0 \rangle, \text{conc}, \Delta_{\sqcup}, 1_{Y_0^*}, \varepsilon). \end{aligned}$$

These algebras, when endowed with their dual laws, are equipped with pure transcendence bases in bijection with the set of Lyndon words $\mathcal{Lyn}(X)$, $\mathcal{Lyn}(Y)$ and $\mathcal{Lyn}(Y_0)$ respectively.

1. Which are all Hopf save the last one due to y_0 which is infiltration-like [2].

Let us consider also the following morphism

$$\begin{aligned} \pi_Y^\circ : (\mathbb{C} \oplus \mathbb{C}\langle X \rangle_{x_1}, \text{conc}) &\longrightarrow (\mathbb{C}\langle Y \rangle, \cdot), \\ x_0^{s_1-1} x_1 \dots x_0^{s_r-1} x_1 &\longmapsto y_{s_1} \dots y_{s_r}, \end{aligned}$$

for $r \geq 1$ and, for any $a \in \mathbb{C}$, $\pi_Y^\circ(a) = a$. The extension of π_Y° over $\mathbb{C}\langle X \rangle$ is denoted by $\pi_Y : \mathbb{C}\langle X \rangle \longrightarrow \mathbb{C}\langle Y \rangle$ satisfying, for any $p \in \mathbb{C}\langle X \rangle_{x_0}$, $\pi_Y(p) = 0$. Hence,

$$\ker(\pi_Y) = \mathbb{C}\langle X \rangle_{x_0} \quad \text{and} \quad \text{Im}(\pi_Y) = \mathbb{C}\langle Y \rangle.$$

Let π_X be the inverse of π_Y° :

$$\begin{aligned} \pi_X : \mathbb{C}\langle Y \rangle &\longrightarrow \mathbb{C} \oplus \mathbb{C}\langle X \rangle_{x_1}, \\ y_{s_1} \dots y_{s_r} &\longmapsto x_0^{s_1-1} x_1 \dots x_0^{s_r-1} x_1. \end{aligned}$$

The projectors π_X^2 and π_Y° are mutual adjoints:

$$\forall p \in \mathbb{C}\langle X \rangle, \forall q \in \mathbb{C}\langle Y \rangle, \quad \langle \pi_Y(p) | q \rangle = \langle p | \pi_X(q) \rangle.$$

In continuation of [5, 7], the principal object of the present work is the *polylogarithm* well defined, for any r -uplet $(s_1, \dots, s_r) \in \mathbb{C}^r$, $r \in \mathbb{N}_+$ and for any $z \in \mathbb{C}$ such that $|z| < 1$, as follows

$$\text{Li}_{s_1, \dots, s_r}(z) := \sum_{n_1 > \dots > n_r > 0} \frac{z^{n_1}}{n_1^{s_1} \dots n_r^{s_r}}. \quad (1)$$

Then the Taylor expansion of the function $(1-z)^{-1} \text{Li}_{s_1, \dots, s_r}(z)$ is given by

$$\frac{\text{Li}_{s_1, \dots, s_r}(z)}{1-z} = \sum_{N \geq 0} H_{s_1, \dots, s_r}(N) z^N,$$

where the coefficient $H_{s_1, \dots, s_r} : \mathbb{N} \longrightarrow \mathbb{Q}$ is an arithmetic function, also called *harmonic sum*, which can be expressed as follows

$$H_{s_1, \dots, s_r}(N) := \sum_{N \geq n_1 > \dots > n_r > 0} \frac{1}{n_1^{s_1} \dots n_r^{s_r}}. \quad (2)$$

From the analytic continuation of polyzetas [9, 24], for any $r \geq 1$, if $(s_1, \dots, s_r) \in \mathcal{H}_r$ satisfies (3) then³, after a theorem by Abel, one obtains the *polyzeta* as follows

$$\lim_{z \rightarrow 1} \text{Li}_{s_1, \dots, s_r}(z) = \lim_{N \rightarrow \infty} H_{s_1, \dots, s_r}(N) = \zeta(s_1, \dots, s_r).$$

This theorem is no more valid in the divergent cases (for $(s_1, \dots, s_r) \in \mathbb{N}^r$) and require the renormalization of the corresponding divergent

2. With a little abuse of language, π_X is now considered as targeted to $\mathbb{C}\langle X \rangle$.

3. For $r \geq 1$, $\zeta(s_1, \dots, s_r)$ is as a meromorphic function on

$$\mathcal{H}_r = \{(s_1, \dots, s_r) \in \mathbb{C}^r \mid m = 1, \dots, r, \Re(s_1) + \dots + \Re(s_m) > 1\}. \quad (3)$$

polyzetas. It is already done for the corresponding case of polyzetas at positive multi-indices [3, 4, 20] and it is done [8, 11, 22] and completed in [5, 7] for the case of polyzetas at positive multi-indices.

To study the polylogarithms at negative multi-indices, one relies on [5, 7]

1. the (one-to-one) correspondence between the multi-indices $(s_1, \dots, s_r) \in \mathbb{N}^r$ and the words $y_{s_1} \dots y_{s_r}$ defined over Y_0 ,
2. indexing these polylogarithms by words $y_{s_1} \dots y_{s_r}$:

$$\text{Li}_{y_{s_1} \dots y_{s_r}}^-(z) = \text{Li}_{s_1, \dots, s_r}^-(z) = \sum_{n_1 > \dots > n_r > 0} n_1^{s_1} \dots n_r^{s_r} z^{n_1}.$$

In the same way, for polylogarithms at positive indices, one relies on [15, 17]

1. the (one-to-one) correspondence between the combinatorial compositions $(s_1, \dots, s_r)$ and the words $x_0^{s_1-1} x_1 \dots x_0^{s_r-1} x_1$ in $X^* x_1 + 1_{X^*}$
2. the indexing of these polylogarithms by words $x_0^{s_1-1} x_1 \dots x_0^{s_r-1} x_1$:

$$\text{Li}_{x_0^{s_1-1} x_1 \dots x_0^{s_r-1} x_1}(z) = \text{Li}_{s_1, \dots, s_r}(z) = \sum_{n_1 > \dots > n_r > 0} \frac{z^{n_1}}{n_1^{s_1} \dots n_r^{s_r}}.$$

Moreover, one obtained the polylogarithms at positive indices as image by the following isomorphism of the shuffle algebra ⁴ [15]

$$\begin{aligned} \text{Li}_\bullet : (\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*}) &\longrightarrow (\mathbb{C}\{\text{Li}_w\}_{w \in X^*}, \times, 1_\Omega), \\ x_0^n &\longmapsto \frac{\log^n(z)}{n!}, \\ x_1^n &\longmapsto \frac{\log^n(1/(1-z))}{n!}, \\ x_0^{s_1-1} x_1 \dots x_0^{s_r-1} x_1 &\longmapsto \sum_{n_1 > \dots > n_r > 0} \frac{z^{n_1}}{n_1^{s_1} \dots n_r^{s_r}}. \end{aligned}$$

Extending over the set of rational power series ⁵ on non commutative variables, $\mathbb{C}^{\text{rat}}\langle\langle X \rangle\rangle$, as follows

$$\begin{aligned} S &= \sum_{n \geq 0} \langle S | x_0^n \rangle x_0^n + \sum_{k \geq 1} \sum_{w \in (x_0^* x_1)^k x_0^*} \langle S | w \rangle w, \\ \text{Li}_S(z) &= \sum_{n \geq 0} \langle S | x_0^n \rangle \frac{\log^n(z)}{n!} + \sum_{k \geq 1} \sum_{w \in (x_0^* x_1)^k x_0^*} \langle S | w \rangle \text{Li}_w, \end{aligned}$$

the morphism $\text{Li}_\bullet$ is no longer injective over $\mathbb{C}^{\text{rat}}\langle\langle X \rangle\rangle$ but $\{\text{Li}_w\}_{w \in X^*}$ are still linearly independant over $\mathbb{C}$ [20, 19].

- EXAMPLE 1. i. $1_\Omega = \text{Li}_{1_{X^*}} = \text{Li}_{x_1^* - x_0^* \sqcup x_1^*}$.
ii. $\lambda = \text{Li}_{(x_0 + x_1)^*} = \text{Li}_{x_0^* \sqcup x_1^*} = \text{Li}_{x_1^* - 1}$.
iii. $\mathcal{C} = \mathbb{C}[\text{Li}_{x_0^*}, \text{Li}_{(-x_0)^*}, \text{Li}_{x_1^*}]$.
iv. $\mathcal{C}\{\text{Li}_w\}_{w \in X^*} = \{\text{Li}_S | S \in \mathbb{C}[x_0^*] \sqcup \mathbb{C}[(-x_0)^*] \sqcup \mathbb{C}[x_1^*] \sqcup \mathbb{C}\langle X \rangle\}$.

Let us consider also the differential and integration operators, acting on $\mathcal{C}\{\text{Li}_w\}_{w \in X^*}$ [21] :

$$\begin{aligned} \partial_z &= \frac{d}{dz}, \theta_0 = z \frac{d}{dz}, \theta_1 = (1-z) \frac{d}{dz}, \\ \forall f \in \mathcal{C}, \quad t_0(f) &= \int_{z_0}^z f(s) \omega_0(s) \quad \text{and} \quad t_1(f) = \int_0^z f(s) \omega_1(s). \end{aligned}$$

4. As follows defined on a superset of the of Lyndon words, as pure transcendence basis, and extended by algebraic specialization [12, 13].

5. $\mathbb{C}^{\text{rat}}\langle\langle X \rangle\rangle$ is the closure by rational operations $\{+, \text{conc}, *\}$ of $\mathbb{C}\langle X \rangle$, where, for $S \in \mathbb{C}\langle\langle X \rangle\rangle$ such that $\langle S | 1_{X^*} \rangle = 0$, one has [1]

$$S^* = \sum_{k \geq 0} S^k.$$

Here, the operator t_0 is well-defined (as in definition 1 in section 2.2) then one can check easily [18, 19, 5, 7]

1. The subspace $\mathcal{C}\{\text{Li}_w\}_{w \in X^*}$ is closed under the action of $\{\theta_0, \theta_1\}$ and $\{t_0, t_1\}$.
2. The operators $\{\theta_0, \theta_1, t_0, t_1\}$ satisfy in particular,
$$\theta_1 + \theta_0 = [\theta_1, \theta_0] = \partial_z \quad \text{and} \quad \forall k = 0, 1, \theta_k t_k = \text{Id},$$

$$[\theta_0 t_1, \theta_1 t_0] = 0 \quad \text{and} \quad (\theta_0 t_1)(\theta_1 t_0) = (\theta_1 t_0)(\theta_0 t_1) = \text{Id}.$$

3. $\theta_0 t_1$ and $\theta_1 t_0$ are scalar operators within $\mathcal{C}\{\text{Li}_w\}_{w \in X^*}$, respectively with eigenvalues λ and $1/\lambda$, i.e.

$$(\theta_0 t_1)f = \lambda f \quad \text{and} \quad (\theta_1 t_0)f = (1/\lambda)f.$$

4. Let $w = y_{s_1} \dots y_{s_r} \in Y^*$ (then $\pi_X(w) = x_0^{s_1-1} x_1 \dots x_0^{s_r-1} x_1$) and $u = y_{t_1} \dots y_{t_r} \in Y_0^*$. The functions $\text{Li}_w, \text{Li}_u^-$ satisfy

$$\begin{aligned} \text{Li}_w &= (t_0^{s_1-1} t_1 \dots t_0^{s_r-1} t_1) 1_\Omega, & \text{Li}_u^- &= (\theta_0^{t_1+1} t_1 \dots \theta_0^{t_r+1} t_1) 1_\Omega, \\ t_0 \text{Li}_{\pi_X(w)} &= \text{Li}_{x_0 \pi_X(w)}, & t_1 \text{Li}_w &= \text{Li}_{x_1 \pi_X(w)}, \\ \theta_0 \text{Li}_{x_0 \pi_X(w)} &= \text{Li}_{\pi_X(w)}, & \theta_1 \text{Li}_{x_1 \pi_X(w)} &= \text{Li}_{\pi_X(w)}, \\ \theta_0 \text{Li}_{x_1 \pi_X(w)} &= \lambda \text{Li}_{\pi_X(w)}, & \theta_1 \text{Li}_{x_1 \pi_X(w)} &= \text{Li}_{\pi_X(w)} / \lambda. \end{aligned}$$

Here, we explain the whole project of extension of $\text{Li}_\bullet$, study different aspects of it, in particular what is desired of $t_i, i = 0, 1$. The interesting problem in here is that what we do expect of $t_i, i = 0, 1$. In fact, the answers are

- it is a section of $\theta_i, i = 0, 1$ (i.e. takes primitives for the corresponding differential operators).
- it extends $t_i, i = 0, 1$ (defined on $\mathbb{C}\{\text{Li}_w\}_{w \in X^*}$, and very surprisingly, although not coming directly from Chen calculus, they provide a group-like generating series)

We will use this construction to extend $\text{Li}_\bullet$ to $\mathcal{C}\{\text{Li}_w\}_{w \in X^*}$ and, after that, we extend it to a much larger rational algebra.

2. Background

2.1 Standard topology on $\mathcal{H}(\Omega)$

The algebra $\mathcal{H}(\Omega)$ is that of analytic functions defined over Ω . It is endowed with the topology of *compact convergence* whose seminorms are indexed by compact subsets of Ω , and defined by

$$p_K(f) = \|f\|_K = \sup_{s \in K} |f(s)|.$$

Of course,

$$p_{K_1 \cup K_2} = \sup(p_{K_1}, p_{K_2}),$$

and therefore the same topology is defined by extracting a *fundamental subset of seminorms*, here it can be choosen denumerable. As $\mathcal{H}(\Omega)$ is complete with this topology it is a Frechet space and even, as

$$p_K(fg) \leq p_K(f)p_K(g),$$

it is a Frechet algebra (even more, as $p_K(1_\Omega) = 1$ a Frechet algebra with unit).

With the standard topology above, an operator $\phi \in \text{End}(\mathcal{H}(\Omega))$ is continuous iff (with K_i compacts of Ω)

$$(\forall K_2)(\exists K_1)(\exists M_{12} > 0)(\forall f \in \mathcal{H}(\Omega))(\|\phi(f)\|_{K_2} \leq M_{12}\|f\|_{K_1}).$$

2.2 Study of continuity of the sections θ_i and t_i

Then, $\mathcal{C}\{\text{Li}_w\}_{w \in X^*}$ (and $\mathcal{H}(\Omega)$) being closed under the operators θ_i ; $i = 0, 1$. We will first build sections of them, then see that they are continuous and, propose (discontinuous) sections more adapted to renormalisation and the computation of associators.

For $z_0 \in \Omega$, let us define $t_i^{z_0} \in \text{End}(\mathcal{H}(\Omega))$ by

$$t_0^{z_0}(f) = \int_{z_0}^z f(s) \omega_0(s), \quad t_1^{z_0}(f) = \int_{z_0}^z f(s) \omega_1(s).$$

It is easy to check that $\theta_i t_i^{z_0} = \text{Id}_{\mathcal{H}(\Omega)}$ and that they are continuous on $\mathcal{H}(\Omega)$ for the topology of compact convergence because for all $K \subset_{\text{compact}} \Omega$, we have

$$|p_K(t_i^{z_0}(f))| \leq p_K(f) \left[\sup_{z \in K} \left| \int_{z_0}^z \omega_i(s) \right| \right],$$

and, in view of paragraph (2.1), this is sufficient to prove continuity. Hence the operators $t_i^{z_0}$ are also well defined on $\mathcal{C}\{\text{Li}_w\}_{w \in X^*}$ and it is easy to check that

$$t_i^{z_0}(\mathcal{C}\{\text{Li}_w\}_{w \in X^*}) \subset \mathcal{C}\{\text{Li}_w\}_{w \in X^*}.$$

Due to the decomposition of $\mathcal{H}(\Omega)$ into a direct sum of closed subspaces

$$\mathcal{H}(\Omega) = \mathcal{H}_{z_0 \mapsto 0}(\Omega) \oplus \mathbb{C}1_\Omega,$$

it is not hard to see that the graphs of θ_i are closed, thus, the θ_i are also continuous.

Much more interesting (and adapted to the explicit computation of associators) we have the operator t_i (without superscripts), mentioned in the introduction and (rigorously) defined by means of a $\mathbb{C}$ -basis of

$$\mathcal{C}\{\text{Li}_w\}_{w \in X^*} = \mathcal{C} \otimes_{\mathbb{C}} \mathbb{C}\{\text{Li}_w\}_{w \in X^*}.$$

As $\mathbb{C}\{\text{Li}_w\}_{w \in X^*} \cong \mathbb{C}[\mathcal{Lyn}(X)]$, one can partition the alphabet of this polynomial algebra in $(\mathcal{Lyn}(X) \cap X^*x_1) \sqcup \{x_0\}$ and then get the decomposition

$$\mathcal{C}\{\text{Li}_w\}_{w \in X^*} = \mathcal{C} \otimes_{\mathbb{C}} \mathbb{C}\{\text{Li}_w\}_{w \in X^*x_1} \otimes_{\mathbb{C}} \mathbb{C}\{\text{Li}_w\}_{w \in X_0^*}.$$

In fact, we have an algorithm to convert $\text{Li}_{ux_1x_0^n}$ as

$$\text{Li}_{ux_1x_0^n}(z) = \sum_{m \leq n} P_m \log^m(z) = \sum_{\substack{m \leq n \\ w \in X^*x_1}} \langle P_m | w \rangle \text{Li}_w(z) \log^m(z).$$

due to the identity [13]

$$ux_1x_0^n = ux_1 \sqcup x_0^n - \sum_{k=1}^n (u \sqcup x_0^k) x_1 x_0^{n-k}.$$

This means that

$$\begin{aligned} \mathcal{B} &= \left(z^k \text{Li}_{ux_1}(z) \text{Li}_{x_0^n}(z) \right)_{(k,n,u) \in \mathbb{Z} \times \mathbb{N} \times X^*} \\ &\sqcup \left(\frac{1}{(1-z)^l} \text{Li}_{ux_1}(z) \text{Li}_{x_0^n}(z) \right)_{(l,n,u) \in \mathbb{N}_+^2 \times X^*} \\ &\sqcup \left(z^k \text{Li}_{x_0^n}(z) \right)_{(k,n) \in \mathbb{Z} \times \mathbb{N}_+} \\ &\sqcup \left(\frac{1}{(1-z)^l} \text{Li}_{x_0^n}(z) \right)_{(k,l,n) \in \mathbb{N}_+^3} \end{aligned}$$

is a $\mathbb{C}$ -basis of $\mathcal{C}\{\text{Li}_w\}_{w \in X^*}$.

With this basis, we can define the operator t_0 as follows

DEFINITION 1. Define the index map $\text{ind} : \mathcal{B} \rightarrow \mathbb{Z}$ by

$$\begin{aligned} \text{ind}\left(\frac{z^k}{(1-z)^l} \text{Li}_{x_0^n}(z)\right) &= k, \\ \text{ind}\left(\frac{z^k}{(1-z)^l} \text{Li}_{ux_1}(z) \log^n(z)\right) &= k + |ux_1|. \end{aligned}$$

Now t_0 is computed by :

1. $t_0(b) = \int_0^z b(s) \omega_0(s)$ if $\text{ind}(b) \geq 1$.
2. $t_0(b) = \int_1^z b(s) \omega_0(s)$ if $\text{ind}(b) \leq 0$.

To show discontinuity of t_0 with a direct example, the technique consists in exhibiting 2 sequences $f_n, g_n \in \mathbb{C}\{\text{Li}_w\}_{w \in X^*}$ converging to the same limit but such that

$$\lim t_0(f_n) \neq \lim t_0(g_n).$$

Here we choose the function z which can be approached by two limits. For continuity, we should have “equality of the limits of the image-sequences” which is not the case.

$$\begin{aligned} z &= \sum_{n \geq 0} \frac{\log^n(z)}{n!}, \\ z &= \sum_{n \geq 1} \frac{(-1)^{n+1}}{n!} \log^n\left(\frac{1}{1-z}\right). \end{aligned}$$

Let then

$$f_n = \sum_{0 \leq m \leq n} \frac{\log^m(z)}{m!} \quad \text{and} \quad g_n = \sum_{1 \leq m \leq n} \frac{(-1)^{m+1}}{m!} \log^m\left(\frac{1}{1-z}\right),$$

we have $f_n, g_n \in \mathbb{C}\{\text{Li}_w\}_{w \in X^*}$ and $t_0(f_n) = f_{n+1} - 1$. Hence, one has $\lim(t_0(f_n)) = z - 1$. On the other hand

$$\lim t_0(g_n) = \lim \int_0^z g_n(s) \omega_0(s) = \int_0^z \lim g_n(s) \omega_0(s) = \int_0^z s \omega_0(s) = z.$$

The exchange of the integral with the limit above comes from the fact that the operator

$$\phi \mapsto \int_0^z \phi(s) \omega_0(s),$$

is continuous on the space $\mathcal{H}_0(\Omega \cup B(0, 1))$ of analytic functions $f \in \mathcal{H}(\Omega \cup B(0, 1))$ such that $f(0) = 0$ ($B(0, 1)$ is the open ball of center 0 and radius 1).

3. Algebraic extension of $\text{Li}_\bullet$ to

$$(\mathbb{C}^{\text{rat}}\langle\langle X \rangle\rangle, \sqcup, \mathbf{1}_{X^*})[\mathbf{x}_0^*, (-\mathbf{x}_0)^*, \mathbf{x}_1^*]$$

We will use several times the following lemma which is characteristic-free.

LEMMA 1. Let $(\mathcal{A}, d)$ be a commutative differential ring without zero divisor, and $R = \ker(d)$ be its subring of constants. Let $z \in \mathcal{A}$ such that $d(z) = 1$ and $S = \{e_\alpha\}_{\alpha \in I}$ be a set of eigenfunctions of d all different ($I \subset R$) i.e.

- i. $e_\alpha \neq 0$.
- ii. $d(e_\alpha) = \alpha e_\alpha$; $\alpha \in I$.

Then the family $(e_\alpha)_{\alpha \in I}$ is linearly free over $R[z]$ ⁶.

PROOF. If there is no non-trivial $R[z]$ -linear relation, we are done. Otherwise let us consider relations

$$\sum_{j=1}^N P_j(z) e_{\alpha_j} = 0, \quad (4)$$

6. Here $R[z]$ is understood as ring adjunction i.e. the smallest subring generated by $R \cup \{z\}$.

with $P_j \in R[t]_{pol} \setminus \{0\}$ ⁷ for all j (packed linear relations). We choose one minimal w.r.t. the triplet

$$[N, \deg(P_N), \sum_{j < N} \deg(P_j)], \quad (5)$$

lexicographically ordered from left to right⁸.

Remarking that $d(P(z)) = P'(z)$ (because $d(z) = 1$), we apply the operator $d - \alpha_N Id$ to both sides of (4) and get

$$\sum_{j=1}^N (P'_j(z) + (\alpha_j - \alpha_N)P_j(z))e_{\alpha_j} = 0. \quad (6)$$

Minimality of (4) implies that (6) is trivial i.e.

$$P'_N(z) = 0; (\forall j = 1..N-1)(P'_j(z) + (\alpha_j - \alpha_N)P_j(z) = 0). \quad (7)$$

Now relation (4) implies

$$\prod_{1 \leq j \leq n-1} (\alpha_N - \alpha_j) \left(\sum_{j=1}^N P_j(z)e_{\alpha_j} \right) = 0, \quad (8)$$

which, because $\mathcal{A}$ has no zero divisor, is packed and has the same associated triplet (5) as (4). From (7), we see that for all $k < N$

$$\prod_{1 \leq j \leq n-1} (\alpha_N - \alpha_j)P_k(z) = \prod_{\substack{1 \leq j \leq n-1 \\ j \neq k}} (\alpha_N - \alpha_j)P'_k(z),$$

so, if $N \geq 2$, we would get a relation of lower triplet (5). This being impossible, we get $N = 1$ and (4) boils down to $P_N(z)e_N = 0$ which, as $\mathcal{A}$ has no zero divisor, implies $P_N(z) = 0$, contradiction.

Then the $(e_{\alpha})_{\alpha \in I}$ are $R[z]$ -linearly independent. $\square$

REMARK 1. If $\mathcal{A}$ is a $\mathbb{Q}$ -algebra or only of characteristic zero (i.e., $n1_{\mathcal{A}} = 0 \Rightarrow n = 0$), then $d(z) = 1$ implies that z is transcendent over R .

First of all, let us prove

LEMMA 2. Let k be a field of characteristic zero and Z an alphabet. Then $(k\langle\langle Z \rangle\rangle, \sqcup, 1_{X^*})$ is a k -algebra without zero divisor.

PROOF. Let $B = (b_i)_{i \in I}$ be an ordered basis of $\mathcal{L}ie_k\langle Z \rangle$ and $(\frac{B^\alpha}{\alpha!})_{\alpha \in \mathbb{N}^{(I)}}$ the divided corresponding PBW basis. One has

$$\Delta_{\sqcup}(\frac{B^\alpha}{\alpha!}) = \sum_{\alpha = \alpha_1 + \alpha_2} \frac{B^{\alpha_1}}{\alpha_1!} \otimes \frac{B^{\alpha_2}}{\alpha_2!}.$$

Hence, if $S, T \in (k\langle\langle Z \rangle\rangle, \sqcup, 1_{X^*})$, considering

$$\langle S \sqcup T \mid \frac{B^\alpha}{\alpha!} \rangle = \langle S \otimes T \mid \Delta_{\sqcup}(\frac{B^\alpha}{\alpha!}) \rangle = \sum_{\alpha = \alpha_1 + \alpha_2} \langle S \mid \frac{B^{\alpha_1}}{\alpha_1!} \rangle \langle T \mid \frac{B^{\alpha_2}}{\alpha_2!} \rangle,$$

we see that $(k\langle\langle Z \rangle\rangle, \sqcup, 1_{X^*}) \simeq (k[[I]], \cdot, 1)$ (commutative algebra of formal series) which has no zero divisor. $\square$

LEMMA 3. Let $\mathcal{A}$ be a $\mathbb{Q}$ -algebra (associative, unital, commutative) and z an indeterminate, then $e^z \in \mathcal{A}[[z]]$ is transcendent over $\mathcal{A}[z]$.

PROOF. It is straightforward consequence of Remark (1). Note that this can be rephrased as $[z, e^z]$ are algebraically independant over $\mathcal{A}$. $\square$

7. Here $R[t]_{pol}$ means the formal univariate polynomial ring (the subscript is here to avoid confusion).

8. i.e. consider the ones with N minimal and among these, we choose one with $\deg(P_N)$ minimal and among these we choose one with $\sum_{j < N} \deg(P_j)$ minimal.

PROPOSITION 1. Let $Z = \{z_n\}_{n \in \mathbb{N}}$ be an alphabet, then $[e^{z_0}, e^{z_1}]$ is algebraically independent on $\mathbb{C}[Z]$ within $\mathbb{C}[[Z]]$.

PROOF. Using lemma 3, one can prove by recurrence that

$$[e^{z_0}, e^{z_1}, \dots, e^{z_k}, z_0, z_1, \dots, z_k],$$

are algebraically independent. This implies that $Z \sqcup \{e^z\}_{z \in Z}$ is an algebraically independent set and, by restriction $Z \sqcup \{e^{z_0}, e^{z_1}\}$ whence the proposition. $\square$

COROLLARY 1. i. The family $\{x_0^*, x_1^*\}$ is algebraically independent over $(\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})$ within $(\mathbb{C}\langle\langle X \rangle\rangle^{\text{rat}}, \sqcup, 1_{X^*})$.
ii. $(\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})[x_0^*, x_1^*, (-x_0)^*]$ is a free module over $\mathbb{C}\langle X \rangle$, the family $\{(x_0^*)^{\sqcup k} \sqcup (x_1^*)^{\sqcup l}\}_{(k,l) \in \mathbb{Z} \times \mathbb{N}}$ is a $\mathbb{C}\langle X \rangle$ -basis of it.
iii. As a consequence, $\{w \sqcup (x_0^*)^{\sqcup k} \sqcup (x_1^*)^{\sqcup l}\}_{\substack{w \in X^* \\ (k,l) \in \mathbb{Z} \times \mathbb{N}}}$ is a $\mathbb{C}$ -basis of it.

PROOF. Chase denominators and use a theorem by Radford [23] with $Z = \mathcal{L}yn(X)$. $\square$

COROLLARY 2. There exists a unique morphism μ , from $(\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})[x_0^*, (-x_0)^*, x_1^*]$ to $\mathcal{H}(\Omega)$ defined by

- i. $\mu(w) = Li_w$ for any $w \in X^*$,
- ii. $\mu(x_0^*) = z$,
- iii. $\mu((-x_0)^*) = 1/z$,
- iv. $\mu(x_1^*) = 1/(1-z)$.

DEFINITION 2. We call $Li_{\bullet}^{(1)}$ the morphism μ .

Remark that the image of $(\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})[x_0^*, (-x_0)^*, x_1^*]$ by $Li_{\bullet}^{(1)}$ (sect. 3) is exactly $\mathcal{C}\{Li_w\}_{w \in X^*}$. And the operator u_0 defined by means of $Li_{\bullet}$ is the same as the one defined by tensor decomposition. We have a diagram as follows

$$\begin{array}{ccc} (\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*}) & \xleftarrow{Li_{\bullet}} & \mathbb{C}\{Li_w\}_{w \in X^*} \\ \downarrow & & \downarrow \\ (\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})[x_0^*, (-x_0)^*, x_1^*] & \xrightarrow{Li_{\bullet}^{(1)}} & \mathcal{C}\{Li_w\}_{w \in X^*} \\ \downarrow & & \downarrow \\ \mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle & \xrightarrow{Li_{\bullet}^{(2)}} & \mathcal{H}(\Omega) \\ \uparrow & \nearrow & \\ \mathbb{C}\langle X \rangle \otimes_{\mathbb{C}} \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \otimes_{\mathbb{C}} \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle & & \end{array}$$

DIAGRAM 1. Arrows and spaces obtained in this project (so far). Among horizontal arrows only $Li_{\bullet}$ is into (and is an isomorphism) $Li_{\bullet}^{(1)}$ and $Li_{\bullet}^{(2)}$ are not into (for example, the image of the non-zero element $x_0^* \sqcup x_1^* - x_1^* + 1$ is zero, see Example 1). The image of $Li_{\bullet}^{(2)}$ is presumably

$$\text{Im}(SP_{\mathbb{C}}(X))\{Li_w\}_{w \in X^*} \simeq \mathbb{C}\{z^\alpha(1-z)^\beta\}_{\alpha, \beta \in \mathbb{C}} \otimes_{\mathbb{C}} \mathbb{C}\{Li_w\}_{w \in X^*}.$$

4. Extension to $\mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle$

4.1 Study of the shuffle algebra $SP_{\mathbb{C}}(X)$

Indeed, the set $(a_0x_0 + a_1x_1)_{a_0, a_1 \in \mathbb{C}}^*$ is a shuffle monoid as

$$(a_0x_0 + a_1x_1)^* \sqcup (b_0x_0 + b_1x_1)^* = ((a_0 + b_0)x_0 + (a_1 + b_1)x_1)^*.$$

As there are many relations between these elements (as a monoid it is isomorphic to $\mathbb{C}^2$, hence far from being free), we study here the vector space

$$SP_{\mathbb{C}}(X) = \text{span}_{\mathbb{C}}\{(a_0x_0 + a_1x_1)^*\}_{a_0, a_1 \in \mathbb{C}}.$$

It is a shuffle sub-algebra of $(\mathbb{C})^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup (\mathbb{C})^{\text{rat}}\langle\langle x_1 \rangle\rangle$ which will be called *star of the plane*. Note that it is also a shuffle sub-algebra of the algebra $(\mathbb{C}^{\text{exch}}\langle\langle X \rangle\rangle, \sqcup, 1_{X^*})$ of exchangeable series. We can give the

DEFINITION 3. A series is said *exchangeable* iff whenever two words have the same multidegree (here bidegree) then they have the same coefficient within it. Formally for all $u, v \in X^*$

$$((\forall x \in X)(|u|_x = |v|_x)) \implies \langle S | u \rangle = \langle S | v \rangle.$$

On the other hand, for any $S \in \mathbb{C}\langle\langle X \rangle\rangle$, we can write

$$S = \sum_{n \geq 0} P_n,$$

where $P_n \in \mathbb{C}[X]$ such that $\deg P_n = n$ for every $n \geq 0$. Then S is called exchangeable iff P_n are symmetric by permutations of places for every $n \in \mathbb{N}$. If S is written as above then we can write

$$P_n = \sum_{i=0}^n \alpha_{n,i} x_0^i \sqcup x_1^{n-i}.$$

DEFINITION 4. Let $S \in \mathbb{C}\langle\langle X \rangle\rangle$ (resp. $\mathbb{C}\langle X \rangle$) and let $P \in \mathbb{C}\langle X \rangle$ (resp. $\mathbb{C}\langle\langle X \rangle\rangle$). The left and right residual of S by P are respectively the formal power series $P \triangleleft S$ and $S \triangleright P$ in $\mathbb{C}\langle\langle X \rangle\rangle$ defined by

$$\langle P \triangleleft S | w \rangle = \langle S | wP \rangle \quad (\text{resp.} \quad \langle S \triangleright P | w \rangle = \langle S | Pw \rangle).$$

For any $S \in \mathbb{C}\langle\langle X \rangle\rangle$ (resp. $\mathbb{C}\langle X \rangle$) and $P, Q \in \mathbb{C}\langle X \rangle$ (resp. $\mathbb{C}\langle\langle X \rangle\rangle$), we straightforwardly get

$$\begin{aligned} P \triangleleft (Q \triangleleft S) &= PQ \triangleleft S, \\ (S \triangleright P) \triangleright Q &= S \triangleright PQ, \\ (P \triangleleft S) \triangleright Q &= P \triangleleft (S \triangleright Q). \end{aligned}$$

In case $x, y \in X$ and $w \in X^*$, we get⁹

$$x \triangleleft (wy) = \delta_x^y w \quad \text{and} \quad xw \triangleright y = \delta_x^y w.$$

THEOREM 1. Let $\delta \in \text{Der}(\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})$. Moreover, we suppose that δ is locally nilpotent¹⁰. Then the family $(t\delta)^n/n!$ is summable and its sum, denoted $\exp(t\delta)$, is a one-parameter group of automorphisms of $(\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})$.

THEOREM 2. Let L be a Lie series¹¹. Let δ_L^r and δ_L^l be defined respectively by

$$\delta_L^r(P) := P \triangleleft L \quad \text{and} \quad \delta_L^l(P) := L \triangleright P.$$

Then δ_L^r and δ_L^l are locally nilpotent derivations of $(\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})$.

Therefore, $\exp(t\delta_L^r)$ and $\exp(t\delta_L^l)$ are one-parameter groups of $\text{Aut}(\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})$ and

$$\exp(t\delta_L^r)P = P \triangleleft \exp(tL) \quad \text{and} \quad \exp(t\delta_L^l)P = \exp(tL) \triangleright P.$$

It is not hard to see that the algebra $\mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle$ is closed by the shuffle derivations¹² $\delta_{x_0}^l, \delta_{x_1}^l$. In particular, on it,

9. For any words $u, v \in X^*$, if $u = v$ then $\delta_u^v = 1$ else 0.

10. $\phi \in \text{End}(V)$ is said to be locally nilpotent iff, for any $v \in V$, there exists $N \in \mathbb{N}$ s.t. $\phi^N(v) = 0$.

11. i.e. $\Delta_{\sqcup}(L) = L \otimes 1 + 1 \otimes L$ [23].

12. These operators are, in fact, the shifts of Harmonic Analysis and therefore defined as adjoints of multiplication, i.e.

$$\forall S \in \mathbb{C}\langle\langle x \rangle\rangle, \quad \langle \delta_x^l(S) | w \rangle = \langle S | xw \rangle.$$

these derivations commute¹³ with $\delta_{x_0}^r$ and $\delta_{x_1}^r$, respectively, i.e., for any $x \in X$ and $S \in \mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle$, one has

$$\delta_x^l(S) = \delta_x^r(S).$$

Moreover, one has

$$(\alpha \delta_{x_0}^l + \beta \delta_{x_1}^l)[(a_0 x_0 + a_1 x_1)^*] = (\alpha a_0 + \beta a_1)[(a_0 x_0 + a_1 x_1)^*],$$

from this we get that the family $\{(a_0 x_0 + a_1 x_1)^*\}_{a_0, a_1 \in \mathbb{C}}$ is linearly free over $\mathbb{C}$

$$SP_{\mathbb{C}}(X) = \bigoplus_{(a_0, a_1) \in \mathbb{C}} \mathbb{C}\{(a_0 x_0 + a_1 x_1)^*\}.$$

We can get an arrow of $\text{Li}_{\bullet}^{(2)}$ type $(SP_{\mathbb{C}}(X), \sqcup, 1_{X^*}) \longrightarrow \mathcal{H}(\Omega)$ by sending

$$(a_0 x_0 + a_1 x_1)^* = (a_0 x_0)^* \sqcup (a_1 x_1)^* \longmapsto z^{a_0} (1 - z)^{-a_1}.$$

In particular, for any $n \in \mathbb{N}_+$, one has

$$\text{Li}_{\underbrace{0, \dots, 0}_{n \text{ times}}}^-(z) = \text{Li}_{(nx_0 + nx_1)^*}^{(2)}(z).$$

This arrow is a morphism for the shuffle product.

4.2 Study of the algebra $\mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle$

We will start by the study of the one-letter shuffle algebra, i.e. $(\mathbb{C}^{\text{rat}}\langle\langle x \rangle\rangle, \sqcup, 1_{X^*})$ and use two times Lemma 1 above.

Let us now consider $\mathcal{A} = \mathbb{C}^{\text{rat}}\langle\langle x \rangle\rangle; e_{\alpha} = (\alpha x)^*$, $\alpha \in \mathbb{C}$ endowed with $d = \delta_x^l$ (which is a derivation for the shuffle) and $z = x$. We are in the conditions of Lemma 1 and then $((\alpha x)^*)_{\alpha \in \mathbb{C}}$ is $\mathbb{C}[x]$ -linearly free which amounts to say that

$$B_0 = (x^{\sqcup k} \sqcup (\alpha x)^*)_{k \in \mathbb{N}, \alpha \in \mathbb{C}},$$

is $\mathbb{C}$ -linearly free in $\mathbb{C}^{\text{rat}}\langle\langle x \rangle\rangle$.

To see that it is a basis, it suffices to prove that B_0 is (linearly) generating. Consider that

$$\mathbb{C}^{\text{rat}}\langle\langle x \rangle\rangle = \{P/Q\}_{P, Q \in \mathbb{C}[x], Q(0) \neq 0},$$

then, as $\mathbb{C}$ is algebraically closed, we have a basis

$$B_1 \cup B_2 = \{x^k\}_{k \geq 0} \cup \{((\alpha x)^*)^l\}_{\alpha \in \mathbb{C}^*, l \geq 1},$$

and it suffices to see that we can generate B_2 by elements of B_0 , which is a consequence of the two identities

$$\begin{aligned} x \sqcup ((\alpha x)^*)^n &= \sum_{j=1}^{n+1} \alpha(n, j) ((\alpha x)^*)^j \quad \text{with } \alpha(n, n+1) \neq 0, \\ x^k \sqcup (\alpha x)^* &= \frac{1}{k!} (x^{\sqcup k} \sqcup (\alpha x)^*). \end{aligned}$$

Now, we use again Lemma 1 with

$$\mathcal{A} = \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle \subset \mathbb{C}\langle\langle x_0, x_1 \rangle\rangle,$$

hence without zero divisor (see Lemma 2), endowed with $d = \delta_{x_1}^l$ then $(x_0^{\sqcup k} \sqcup (\alpha x_0)^*)_{\substack{k \in \mathbb{N}; \\ \alpha \in \mathbb{C}}}$ is linearly free over $R = \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle$. It is easily seen, using a decomposition like

$$S = \sum_{p \geq 0, q \geq 0} \langle S | x_0^{\sqcup p} \sqcup x_1^{\sqcup q} \rangle x_0^{\sqcup p} \sqcup x_1^{\sqcup q},$$

13. Thus, in this case, the operator δ_x^l has the same meaning as the operator $S \rightarrow S_x$ in [6], x^{-1} in the Theory of Languages and $\circ$ in [1, 23].

that $\mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle = \ker(d)$ and one obtains then that the arrow

$$\mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \otimes_{\mathbb{C}} \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle \rightarrow \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle \subset \mathbb{C}^{\text{rat}}\langle\langle x_0, x_1 \rangle\rangle$$

is an isomorphism. Hence, $(x_0^{\sqcup k_0} \sqcup (\alpha_0 x_0)^* \sqcup x_1^{\sqcup k_1} \sqcup (\alpha_1 x_1)^*)_{\substack{k_i \in \mathbb{N}; \\ \alpha_i \in \mathbb{C}}} \bullet$ is a $\mathbb{C}$ -basis of $\mathcal{A} = \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle$. In order to extend $\text{Li}_\bullet$ to $\mathcal{A}$ we send

$$T(k_0, k_1, \alpha_0, \alpha_1) = x_0^{\sqcup k_0} \sqcup (\alpha_0 x_0)^* \sqcup x_1^{\sqcup k_1} \sqcup (\alpha_1 x_1)^*,$$

to $\log^{k_0}(z)z^{\alpha_0} \log^{k_1}(1/(1-z))(1/(1-z))^{\alpha_1}$, and see that the constructed arrow follows multiplication given by

$$T(j_0, j_1, \alpha_0, \alpha_1)T(k_0, k_1, \beta_0, \beta_1) = T(j_0 + k_0, j_1 + k_1, \alpha_0 + \beta_0, \alpha_1 + \beta_1).$$

Using, once more, Lemma 1, one gets

PROPOSITION 2. *The family $\{(\alpha_0 x_0)^* \sqcup (\alpha_1 x_1)^*\}_{\alpha_i \in \mathbb{C}}$ is a $(\mathbb{C}\langle X \rangle, \sqcup, 1)$ -basis of $\mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle$, then we have a $\mathbb{C}$ -basis $\{w \sqcup (\alpha_0 x_0)^* \sqcup (\alpha_1 x_1)^*\}_{\substack{\alpha_i \in \mathbb{C}; \\ w \in X^*}}$ of*

$$\begin{aligned} \mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle &= \mathbb{C}\langle X \rangle[\mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle] \\ &= \mathbb{C}\langle X \rangle \sqcup SP_{\mathbb{C}}(X). \end{aligned}$$

PROOF. We will use a multi-parameter consequence of Lemma 1.

LEMMA 4. *Let Z be an alphabet, and k a field of characteristic zero. Then, the family $\{e^{\alpha z}\}_{\substack{z \in Z \\ \alpha \in k}} \subset k[[Z]]$ is linearly independent over $k[Z]$.*

This proves that, in the shuffle algebra the elements

$$\{(a_0 x_0)^* \sqcup (a_1 x_1)^*\}_{a_0, a_1 \in \mathbb{C}^2}$$

are linearly independent over $\mathbb{C}\langle X \rangle \simeq \mathbb{C}[\mathcal{Lyn}(X)]$ within $(\mathbb{C}\langle\langle X \rangle\rangle, \sqcup, 1_{X^*})$. $\square$

Now $\text{Li}_\bullet^{(2)}$ is well-defined and this morphism is not into from

$$\begin{aligned} \mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle &= \\ \mathbb{C}\langle X \rangle[\mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle] &= \mathbb{C}\langle X \rangle \sqcup SP_{\mathbb{C}}(X), \end{aligned}$$

to $\text{Im}(\text{Li}_\bullet^{(2)})$.

PROPOSITION 3. *Let $\text{Li}_\bullet^{(1)} : \mathbb{C}\langle X \rangle[x_0^*, x_1^*, (-x_0)^*] \rightarrow \mathcal{H}(\Omega)$ then*

- $\text{Im}(\text{Li}_\bullet^{(1)}) = \mathcal{C}\{\text{Li}_w\}_{w \in X^*}$.
- $\ker(\text{Li}_\bullet^{(1)})$ is the ideal generated by $x_0^* \sqcup x_1^* - x_1^* + 1_{X^*}$.

PROOF. As $\mathbb{C}\langle X \rangle[x_0^*, x_1^*, (-x_0)^*]$ admits $\{(x_0^*)^{\sqcup k} \sqcup (x_1^*)^{\sqcup l}\}_{\substack{k \in \mathbb{N}; \\ l \in \mathbb{Z}}}$ as a basis for its structure of $\mathbb{C}\langle X \rangle$ -module, it suffices to remark

$$\text{Li}_\bullet^{(1)}(x_0^*)^{\sqcup k} \sqcup (x_1^*)^{\sqcup l}(z) = z^k \times \frac{1}{(1-z)^l}$$

is a generating system of $\mathcal{C}$.

First of all, we recall the following lemma

LEMMA 5. *Let M_1 and M_2 be K -modules (K is a unitary ring). Suppose $\phi : M_1 \rightarrow M_2$ is a linear mapping. Let $N \subset \ker(\phi)$ be a submodule. If there is a system of generators in M_1 , namely $\{g_i\}_{i \in I}$, such that*

- For any $i \in I \setminus J$, $g_i \equiv \sum_{j \in J \setminus I} c_i^j g_j [\text{mod } N]$, ($c_i^j \in K; \forall j \in J$);

- $\{\phi(g_j)\}_{j \in J}$ is K -free in M_2 ;

then $N = \ker(\phi)$.

PROOF. Suppose $P \in \ker(\phi)$. Then $P \equiv \sum_{j \in J} p_j g_j [\text{mod } N]$ with $\{p_j\}_{j \in J} \subset K$. Then $0 = \phi(P) = \sum_{j \in J} p_j \phi(g_j)$. From the fact that $\{\phi(g_j)\}_{j \in J}$ is K -free on M_2 , we obtain $p_j = 0$ for any $j \in J$. This means that $P \in N$. Thus $\ker(\phi) \subset N$. This implies that $N = \ker(\phi)$. $\square$

Figure 1: Rewriting mod $\mathcal{J}$ of $\{w \sqcup (x_0^*)^{\sqcup l} \sqcup (x_1^*)^{\sqcup k}\}_{\substack{k \in \mathbb{N}, l \in \mathbb{Z}; \\ w \in X^*}}$.

Let now $\mathcal{J}$ be the ideal generated by $x_0^* \sqcup x_1^* - x_1^* + 1_{X^*}$. It is easily checked, from the following formulas, (for $l \geq 1$)¹⁴

$$\begin{aligned} w \sqcup x_0^* \sqcup (x_1^*)^{\sqcup l} &\equiv w \sqcup (x_1^*)^{\sqcup l} - w \sqcup (x_1^*)^{\sqcup l-1} [\mathcal{J}], \\ w \sqcup (-x_0)^* \sqcup (x_1^*)^{\sqcup l} &\equiv w \sqcup (-x_0)^* \sqcup (x_1^*)^{\sqcup l-1} + w \sqcup (x_1^*)^{\sqcup l} [\mathcal{J}], \end{aligned}$$

that one can rewrite [mod $\mathcal{J}$] any monomial $w \sqcup (x_0^*)^{\sqcup k} \sqcup (x_1^*)^{\sqcup l}$ as a linear combination of such monomials with $kl = 0$. Then, applying lemma 5 to the map $\phi = \text{Li}_\bullet^{(1)}$ and the modules

$$M_1 = \mathbb{C}\langle X \rangle[x_0^*, x_1^*, (-x_0)^*], \quad M_2 = \mathcal{H}(\Omega), \quad N = \mathcal{J},$$

the families and indices

$$\begin{aligned} \{g_i\} &= \{w \sqcup (x_1^*)^{\sqcup n} \sqcup (x_0^*)^{\sqcup m}\}_{(w, n, m) \in I}, \\ I &= X^* \times \mathbb{N} \times \mathbb{Z}, \\ J &= (X^* \times \mathbb{N} \times \{0\}) \sqcup (X^* \times \{0\} \times \mathbb{Z}), \end{aligned}$$

we have the second point of proposition 3.

Of course, we also have $(x_0^* \sqcup x_1^* - x_1^* + 1_{X^*}) \subset \ker(\text{Li}_\bullet^{(2)})$, but the converse is conjectural.

5. Applications on polylogarithms

Let us consider also the following morphisms $\mathfrak{I}$ and Θ of algebras $\mathbb{C}\langle X \rangle \rightarrow \text{End}(\mathcal{C}\{\text{Li}_w\})$ defined by

- $\mathfrak{I}(w) = \text{Id}$ and $\Theta(w) = \text{Id}$, if $w = 1_{X^*}$.
- $\mathfrak{I}(w) = \mathfrak{I}(v)_{l_i}$ and $\Theta(w) = \Theta(v)_{\theta_i}$, if $w = vx_i, x_i \in X, v \in X^*$.

For any $n \geq 0$ and $u \in X^*$, $f, g \in \mathcal{C}\{\text{Li}_w\}_{w \in X^*}$, one has [5, 7]

$$\partial_z^n = \sum_{w \in X^n} \mu \circ (\Theta \otimes \Theta)[\Delta_{\sqcup}(w)],$$

$$\Theta(u)(fg) = \mu \circ (\Theta \otimes \Theta)[\Delta_{\sqcup}(u)] \circ (f \otimes g).$$

By extension to complex coefficients, we obtain

$$\begin{aligned} \mathcal{H}_{\text{conc}} &\cong (\mathbb{C}\langle\Theta(X)\rangle, \text{conc}, \text{Id}, \Delta_{\sqcup}, \varepsilon), \\ \mathcal{H}_{\sqcup} &\cong (\mathbb{C}\langle\mathfrak{I}(X)\rangle, \sqcup, \text{Id}, \Delta_{\text{conc}}, \varepsilon). \end{aligned}$$

Hence,

14. In figure 1, (w, l, k) codes the element $w \sqcup (x_0^*)^{\sqcup l} \sqcup (x_1^*)^{\sqcup k}$.

THEOREM 3 (DERIVATIONS AND AUTOMORPHISMS).

Let $P, Q \in \mathbb{C}\langle X \rangle$ (resp. $\mathbb{C}[x_0^*, (-x_0)^*, x_1^*] \sqcup \mathbb{C}\langle X \rangle$), $T \in \mathcal{L}ie_{\mathbb{C}}\langle\langle X \rangle\rangle$ (resp. $\mathcal{L}ie_{\mathbb{C}}\langle X \rangle$). Then $\Theta(T)$ is a derivation in $(\mathbb{C}\{\text{Li}_w\}_{w \in X^*}, \times, 1)$ (resp. $(\mathcal{C}\{\text{Li}_w\}_{w \in X^*}, \times, 1_{\Omega})$) and $\exp(\text{t}(\Theta(T)))$ is then a one-parameter group of automorphisms of

$$(\mathbb{C}\{\text{Li}_w\}_{w \in X^*}, \times, 1_{\Omega}) \quad (\text{resp.} \quad (\mathcal{C}\{\text{Li}_w\}_{w \in X^*}, \times, 1_{\Omega})).$$

PROOF. Because $\text{Li}_{P \sqcup Q} = \text{Li}_P \text{Li}_Q$, $\Theta(T) \text{Li}_{P \sqcup Q} = \text{Li}_{(P \sqcup Q) \triangleleft T}$ and then $\Theta(T)(\text{Li}_P \text{Li}_Q) = \text{Li}_{(P \sqcup Q) \triangleleft T} = \text{Li}_{(P \triangleleft T) \sqcup Q + P \sqcup (Q \triangleleft T)} = \text{Li}_{(P \triangleleft T) \sqcup Q} + \text{Li}_{P \sqcup (Q \triangleleft T)} = (\Theta(T) \text{Li}_P) \text{Li}_Q + \text{Li}_P (\Theta(T) \text{Li}_Q)$. $\square$

THEOREM 4 (EXTENSION OF $\text{Li}_{\bullet}$).

The following map is surjective

$$\begin{aligned} (\mathbb{C}[x_0^*] \sqcup \mathbb{C}[(-x_0)^*] \sqcup \mathbb{C}[x_1^*] \sqcup \mathbb{C}\langle X \rangle, \sqcup, 1_{X^*}) &\rightarrow (\mathcal{C}\{\text{Li}_w\}_{w \in X^*}, \times, 1), \\ T &\mapsto \mathfrak{Z}(T)1_{\Omega}. \end{aligned}$$

One has, for any $u \in Y^*$,

$$\text{Li}_{y_{s_1} u}^- = \theta_0^{s_1}(\theta_0 1_1) \text{Li}_u^- = \theta_0^{s_1}(\lambda \text{Li}_u^-) = \sum_{k_1=0}^{s_1} \binom{s_1}{k_1} (\theta_0^{k_1} \lambda) (\theta_0^{s_1-k_1} \text{Li}_u^-).$$

Hence, successively [5],

$$\begin{aligned} \text{Li}_{y_{s_1} \dots y_{s_r}}^- &= \sum_{k_1=0}^{s_1} \sum_{k_2=0}^{s_1+s_2-k_1} \dots \sum_{k_r=0}^{(s_1+\dots+s_r)-(k_1+\dots+k_{r-1})} \binom{s_1}{k_1} \binom{s_1+s_2-k_1}{k_2} \dots \\ &\quad \binom{s_1+\dots+s_r-k_1-\dots-k_{r-1}}{k_r} (\theta_0^{k_1} \lambda) (\theta_0^{k_2} \lambda) \dots (\theta_0^{k_r} \lambda), \end{aligned}$$

where

$$\theta_0^{k_i} \lambda(z) = \begin{cases} \lambda(z), & \text{if } k_i = 0, \\ \frac{1}{1-z} \sum_{j=1}^{k_i} S_2(k_i, j) j! \lambda^j(z), & \text{if } k_i > 0. \end{cases}$$

Hence,

$$\text{Li}_{y_{s_1} \dots y_{s_r}}^- = \text{Li}_T = \mathfrak{Z}(T)1_{\Omega},$$

where T is the following exchangeable rational series

$$\begin{aligned} T &= \sum_{k_1=0}^{s_1} \sum_{k_2=0}^{s_1+s_2-k_1} \dots \sum_{k_r=0}^{(s_1+\dots+s_r)-(k_1+\dots+k_{r-1})} \binom{s_1}{k_1} \binom{s_1+s_2-k_1}{k_2} \dots \\ &\quad \binom{s_1+\dots+s_r-k_1-\dots-k_{r-1}}{k_r} T_{k_1} \sqcup \dots \sqcup T_{k_r}, \\ T_{k_i} &= \begin{cases} (x_0 + x_1)^*, & \text{if } k_i = 0, \\ x_1^* \sqcup \sum_{j=1}^{k_i} S_2(k_i, j) j! ((x_0 + x_1)^*)^{\sqcup j}, & \text{if } k_i > 0. \end{cases} \end{aligned}$$

Due to surjectivity of $\text{Li}_{\bullet}$, from $\mathbb{C}[x_0^*] \sqcup \mathbb{C}[(-x_0)^*] \sqcup \mathbb{C}[x_1^*] \sqcup \mathbb{C}\langle X \rangle$ to $\mathcal{C}\{\text{Li}_w\}_{w \in X^*}$, one also has

$$\text{Li}_{y_{s_1} \dots y_{s_r}}^- = \text{Li}_R = \mathfrak{Z}(R)1_{\Omega},$$

where R is the following exchangeable rational series

$$\begin{aligned} R &= \sum_{k_1=0}^{s_1} \sum_{k_2=0}^{s_1+s_2-k_1} \dots \sum_{k_r=0}^{(s_1+\dots+s_r)-(k_1+\dots+k_{r-1})} \binom{s_1}{k_1} \binom{s_1+s_2-k_1}{k_2} \dots \\ &\quad \binom{s_1+\dots+s_r-k_1-\dots-k_{r-1}}{k_r} R_{k_1} \sqcup \dots \sqcup R_{k_r}, \\ R_{k_i} &= \begin{cases} x_0^* \sqcup x_1^*, & \text{if } k_i = 0, \\ x_1^* \sqcup \sum_{j=1}^{k_i} S_2(k_i, j) j! (x_0^* \sqcup x_1^*)^{\sqcup j}, & \text{if } k_i > 0, \end{cases} \end{aligned}$$

and again (see Example 1)

$$\text{Li}_{y_{s_1} \dots y_{s_r}}^- = \text{Li}_F = \mathfrak{Z}(F)1_{\Omega},$$

where F is the following rational series on x_1

$$\begin{aligned} F &= \sum_{k_1=0}^{s_1} \sum_{k_2=0}^{s_1+s_2-k_1} \dots \sum_{k_r=0}^{(s_1+\dots+s_r)-(k_1+\dots+k_{r-1})} \binom{s_1}{k_1} \binom{s_1+s_2-k_1}{k_2} \dots \\ &\quad \binom{s_1+\dots+s_r-k_1-\dots-k_{r-1}}{k_r} F_{k_1} \sqcup \dots \sqcup F_{k_r}, \\ F_{k_i} &= \begin{cases} x_1^* - 1_{X^*}, & \text{if } k_i = 0, \\ x_1^* \sqcup \sum_{j=1}^{k_i} S_2(k_i, j) j! (x_1^* - 1_{X^*})^{\sqcup j}, & \text{if } k_i > 0. \end{cases} \end{aligned}$$

Since $\mathfrak{Z}(x_1^*)1_{\Omega} = 1/(1-z)$ then this proves once again that [5, 7]

$$\text{Li}_{y_{s_1} \dots y_{s_r}}^- = \text{Li}_T = \text{Li}_R = \text{Li}_F \in \mathbb{C}[1/(1-z)] \subsetneq \mathcal{C}.$$

One can deduce finally that

COROLLARY 3.

$$\begin{aligned} \mathcal{C}\{\text{Li}_w\}_{w \in X^*} &\supsetneq \mathbb{C}[1/(1-z)]\{\text{Li}_w\}_{w \in X^*} \\ &= \text{span}_{\mathbb{C}} \left\{ \sum_{n_1 > \dots > n_r > 0} n_1^{s_1} \dots n_r^{s_r} z^{n_1} \right\}. \end{aligned}$$

6. Conclusion

We have studied the structure of the algebra

$$\mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle,$$

where $X = \{x_0, x_1\}$ is an alphabet. We have also considered the ways for denoting the polylogarithms. By the results on the algebra $\mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle$, we have given an extension of the polylogarithms and have obtained *polylogarithmic transseries*

$$\mathbb{C}\{z^{\alpha}(1-z)^{\beta} \text{Li}_w\}_{\substack{w \in X^* \\ \alpha, \beta \in \mathbb{C}}}.$$

With this extension, we have constructed several shuffle bases of the algebra of polylogarithms. In the special case of the “Laurent subalgebra”

$$(\mathbb{C}\langle X \rangle, \sqcup, 1_{X^*})[x_0^*, (-x_0)^*, x_1^*] \subset \mathbb{C}\langle X \rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_0 \rangle\rangle \sqcup \mathbb{C}^{\text{rat}}\langle\langle x_1 \rangle\rangle,$$

we have completely characterized the kernel of the polylogarithmic map $\text{Li}_{\bullet}$, providing a rewriting process which terminates to a normal form.
